Basic safety precautions should always be followed, including the following: Failure to follow instructions can cause severe injury and/or death.

⚠️ This is the safety-alert symbol. When you see this symbol on your equipment or in this manual, look for one of the following signal words and be alert to the potential for personal injury.

⚠️ WARNING warns about hazards that could cause serious personal injury, death or major property damage and if ignored presents a potential hazard.

⚠️ CAUTION warns about hazards that will or can cause minor or moderate personal injury and/or property damage and if ignored presents a potential hazard. It can also make consumers aware of actions that are unpredictable and unsafe.

The NOTICE label indicates special instructions that are important but not related to hazards.

SAVE THIS OWNERS MANUAL

All Hayward HeatPro Heat Pumps must be installed in accordance with all applicable National and Local codes. In the absence of local codes, refer to the latest edition of the National Electric Code (NEC) in the United States and the Canadian Electric Code (CEC) in Canada.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS
IMPORTANT SAFETY INSTRUCTIONS

READ AND FOLLOW ALL INSTRUCTIONS IN THIS OWNER’S MANUAL AND ON EQUIPMENT.

Before servicing this electrical equipment, turn power supply OFF.

KEEP ALL LABELS IN GOOD CONDITION AND REPLACE IF MISSING OR DAMAGED.

⚠️ WARNING ⚠️ — To reduce risk of injury, do not permit children to use or climb on the heat pump, pumps or filters. Closely supervise children at all times. Components such as the filtration system, pumps, and heaters must be positioned to prevent children from using them as a means of access to the pool.

⚠️ CAUTION ⚠️ — This heat pump is intended for use on permanently installed swimming pools and may also be used with spas. Do NOT use with storable pools. A permanently installed pool is constructed in or on the ground or in a building such that it cannot be readily disassembled for storage. A storable pool is constructed so that it is capable of being readily disassembled for storage and reassembled to its original integrity.

Though this product is designed for outdoor use, it is strongly recommended to protect the electrical components from the weather. Select a well-drained area, one that will not flood when it rains. It requires free circulation of air for cooling. Do not install in a damp or non-ventilated location.

⚠️ WARNING ⚠️ — Risk of Electric Shock. All electrical wiring MUST be in conformance with all applicable local codes, regulations and the National Electric Code (NEC). Hazardous voltage can shock, burn, and cause death or serious property damage. Provide a properly located outlet. All electrical wiring MUST be in conformance with applicable local and national codes and regulations. Before working on this unit, turn off power supply to the heat pump.

⚠️ WARNING ⚠️ — To reduce the risk of electric shock replace damaged wiring immediately. Locate conduit to prevent abuse from lawn mowers, hedge trimmers and other equipment.

⚠️ WARNING ⚠️ — Failure to bond heat pump to pool structure will increase risk for electrocution and could result in injury or death. To reduce the risk of electric shock, the electrician must comply with installation instructions and must bond the heat pump accordingly. In addition, the licensed electrician must also conform to local electrical codes for bonding requirements.

Notes to the electrician:

Use a solid copper conductor, size 8 or larger. Run a continuous wire from external bonding lug to reinforcing rod or mesh. Connect a No. 8 AWG (8.4 mm²) solid copper bonding wire to the grounding lug provided on the heat pump and to all metal parts of swimming pool or spa, and to all electrical equipment, metal piping (except gas piping), and conduit within 5 ft. (1.5 m) of inside walls of swimming pool or spa. IMPORTANT - Reference NEC codes for all wiring standards including, but not limited to, grounding, bonding and other general wiring procedures.

⚠️ WARNING ⚠️ — Suction Entrapment Hazard.
Suction in suction outlets and/or suction outlet covers which are damaged, broken, cracked, missing, or unsecured can cause severe injury and/or death due to the following entrapment hazards:

Hair Entrapment - Hair can become entangled in suction outlets.

Limb Entrapment - A limb inserted into an opening of a suction outlet or suction outlet cover that is damaged, broken, cracked, missing, or not securely attached can result in a mechanical bind or swelling of the limb.

Body Suction Entrapment - A differential pressure applied to a large portion of the body or limbs can result in an entrapment.

Evisceration/Disembowelment - A vacuum applied directly to the intestines through an unprotected suction outlet sump or suction outlet cover which is damaged, broken, cracked, missing, or unsecured can result in evisceration (disembowelment).

Mechanical Entrapment - There is potential for jewelry, swimsuit, hair decorations, finger, toe or knuckle to be caught in an opening of a suction outlet or suction outlet cover resulting in mechanical entrapment.

⚠️ WARNING ⚠️ — To reduce the risk of entrapment hazards:

- When suction outlets are less than a 18” x 23” [45cm x 58cm] equivalent, a minimum of two functioning suction outlets per pump must be installed. Suction outlets in the same plane (i.e. floor or wall), must be installed a minimum of three feet (3’) [1 m] apart, as measured from near point to near point.

- Dual suction outlets shall be placed in such locations and distances to avoid “dual blockage” by a user.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Pomona, CA Clemmons, NC Nashville, TN
Tel: 908.351.5400 www.haywardpool.com
Never use the Pool or Spa if any suction outlet component is damaged, broken, cracked, missing, or not securely attached. Replace damaged, broken, cracked, missing, or not securely attached suction outlet components immediately.

In addition two or more suction outlets per pump installed in accordance with latest APSP (formally NSPI) Standards and CPSC guidelines, follow all National, State, and Local codes applicable.

**WARNING – Never operate or test the circulation system at more than 50 PSI.**

**WARNING – Failure to remove pressure test plugs and/or plugs used in winterization of the pool/spa from the suction outlets can result in an increase potential for suction entrapment as described above.**

**WARNING – Failure to keep suction outlet components clear of debris, such as leaves, dirt, hair, paper and other materials can result in an increase potential for suction entrapment as described above.**

**WARNING – Suction outlet components have a finite life, the cover/grate should be inspected frequently and replaced at least every ten years or if found to be damaged, broken, cracked, missing, or not securely attached.**

**WARNING – All suction and discharge valves MUST be OPEN when starting the circulation system. Failure to do so could result in severe personal injury and/or property damage. All drains and suction outlets MUST have properly installed covers, securely attached using the screws supplied with the covers. If screws are lost, order replacement parts from your supplier.**

**WARNING – Hazardous Pressure.** Pool and spa water circulation systems operate under hazardous pressure during start up, normal operation, and after pump shut off. Stand clear of circulation system equipment during start up. Failure to follow safety and operation instructions could result in violent separation of the pump housing and cover due to pressure in the system, which could cause property damage, severe personal injury, or death. Before servicing pool and spa water circulation system, all system and pump controls must be in off position and filter manual air relief valve must be in open position. Before starting system pump, all system valves must be set in a position to allow system water to return back to the pool. Do not change filter control valve position while system pump is running. Before starting system pump, fully open filter manual air relief valve. Do not close filter manual air relief valve until a steady stream of water (not air or air and water) is discharged.

**WARNING – Separation Hazard.** Failure to follow safety and operation instructions could result in violent separation of pump components. Strainer cover must be properly secured to pump housing with strainer cover lock ring. Before servicing pool and spa circulation system, filter manual air relief valve must be in open position. Do not operate pool and spa circulation system if a system component is not assembled properly, damaged, or missing. Do not operate pool and spa circulation system unless filter air relief valve body is in locked position in filter upper body.

**WARNING – Fire and burn hazard.** Motors operate at high temperatures and if they are not properly isolated from any flammable structures or foreign debris they can cause fires, which may cause severe personal injury or death. It is also necessary to allow the motor to cool for at least 20 minutes prior to maintenance to minimize the risk of burns.

**WARNING – Failure to install according to defined instructions may result in severe personal injury or death.**

**WARNING – The following “Safety Rules for Hot Tubs” recommended by the U.S. Consumer Product Safety Commission should be observed when using the spa.**

1. Spa or hot tub water temperatures should never exceed 104°F [40°C]. A temperature of 100°F [38°C] is considered safe for a healthy adult. Special caution is suggested for young children. Prolonged immersion in hot water can induce hyperthermia.

2. Drinking of alcoholic beverages before or during spa or hot tub use can cause drowsiness, which could lead to unconsciousness and subsequently result in drowning.

3. **Pregnant women beware!** Soaking in water above 100°F [38°C] can cause fetal damage during the first three months of pregnancy (resulting in the birth of a brain-damaged or deformed child). Pregnant women should adhere to the 100°F [38°C] maximum rule.

4. Before entering the spa or hot tub, users should check the water temperature with an accurate thermometer; spa or hot tub thermostats may err in regulating water temperatures by as much as 4°F (2.2°C).

5. Persons taking medications, which induce drowsiness, such as tranquilizers, antihistamines or anticoagulants, should not use spas or hot tubs.

---

**USE ONLY HAYWARD GENUINE REPLACEMENT PARTS**
6. If the pool/spa is used for therapy, it should be done with the advice of a physician. Always stir pool/spa water before entering the pool/spa to mix in any hot surface layer of water that might exceed healthful temperature limits and cause injury. Do not tamper with controls, because scalding can result if safety controls are not in proper working order.

7. Persons with a medical history of heart disease, circulatory problems, diabetes or blood pressure problems should obtain a physicians advice before using spas or hot tubs.

8. Hyperthermia occurs when the internal temperature of the body reaches a level several degrees above normal body temperature of 98.6°F [37°C]. The symptoms of Hyperthermia include: drowsiness, lethargy, dizziness, fainting, and an increase in the internal temperature of the body.

The effects of Hyperthermia include:

1. Unawareness of impending danger.
2. Failure to perceive heat.
3. Failure to recognize the need to leave the spa.
4. Physical inability to exit the spa.
5. Fetal damage in pregnant women.
6. Unconsciousness resulting in danger of drowning.

DEFINITIONS:

Suction Outlet – The term Suction Outlet is a fitting, fitting assembly, cover/grate and related components that provide a means for water to exit the pool and into the pump circulating system.

Inches of Mercury (in Hg) - A unit for measuring pressure below atmospheric (“suction” or “vacuum”) (1.0 inch Hg = .491 PSI)

Main Drain – See Suction Outlet

PSI – An abbreviation for pounds per square inch.

General Information:

Swimming Pool Energy Saving Tips

It is important to note that a heat pump will not heat a pool as fast as a gas heater. If the pool water is allowed to cool significantly, it may take a heat pump several days to return pool water to the desired temperature. For weekend use, it is more economical to maintain the pool water temperature at the desired temperature.

Hayward Pool Products offers the following recommendations to help conserve energy and minimize the cost of operating the heat pump.

1. Carefully monitor the water temperature of the pool in the summertime.

2. During the winter or when on vacation longer than a week, turn off the heat pump and follow the winterization procedures in this manual. If pool use is not planned for a prolonged period, energy consumption can be minimized by either turning off the heat pump or by decreasing the temperature setting several degrees.

3. Where possible, shelter the pool from prevailing winds with well-trimmed hedges or other landscaping, cabanas, or fencing.

4. The use of a pool cover is recommended. A pool cover will provide a valuable safety feature, reduce heat loss, conserve chemicals, and reduce the load on filter systems.
The following table lists the minutes it will take to heat a pool 1°F, based on gallons. This is an approximation only.

**Features:**
- UV resistant cabinet;
- Scroll compressor for quiet operation;
- Energy efficient heating of your pool and spa;
- Digital Electronic Control (All Models):
  - Easy to read display;
  - Continuous digital temperature display;
  - Dual thermostats for independent temperature control of pool and spa
  - Display of self diagnostic codes to monitor heat pump performance;
  - Control Lock Out Function;
  - Defrost Function to prevent evaporator coil freeze up;
- Titanium Heat Exchanger withstands the harshest conditions.
How a Heat Pump Works

The heat pump takes heat from the environment and uses it to heat the pool water. During heat pump operation, high temperature, high-pressure sub cooled liquid Refrigerant (A) is throttled by Metering Device (TXV) and turned into low temperature, low-pressure saturated liquid (B). The two-phase Refrigerant flows through the Air Coil (Evaporator), where the liquid refrigerant evaporates into vapor by absorbing heat from the surrounding air. At the outlet of the Air Coil (Evaporator) it becomes a low temperature, low-pressure superheated vapor (C). The Compressor receives this flow at the suction line (D), and compresses it into a high temperature, high pressure superheated vapor, which is discharged from the Compressor (E) and flows into the Water Heat Exchanger (Condenser). The heat carried by the flow is then released to the surrounding water from the pool. At the same time, the high temperature, high-pressure superheated vapor is then condensed back to high-pressure sub cooled liquid (A), which completes the cycle. The water, which is being forced through the Water Heat Exchanger (Condenser) by the pool pump, is heated as it passes through.

Becoming Familiar with Your Heat Pump

Heat Pump Protection Features

Hayward heat pumps are equipped with safeguards that will stop operation to protect the unit in case of the following events:

- Excessively high refrigerant pressure
- Excessively high water temperature
- Loss of refrigerant
- Fan Motor Failure
- Evaporator Freeze-up
- Low Ambient Temperature
High / Low Refrigerant Pressure Switches

- The high-pressure switch senses the refrigerant pressure in the sealed refrigeration system and turns the heat pump off if the operating pressure exceeds the acceptable range. The heat pump will automatically reset the switch after the system pressure returns to normal operating conditions. The display will show “HI”, if this switch is tripped.

- The low-pressure switch senses the refrigerant pressure in the sealed refrigeration system to protect against certain conditions that could be detrimental to compressor life. The switch turns the heat pump off in the event of loss of refrigerant, fan motor failure, evaporator freeze-up, or airflow blockage. The heat pump will automatically reset the switch after the system pressure returns to normal operating conditions. The display will show “LP”, if this switch is tripped.

Water Pressure Switch

Adequate water flow through the heat pump causes the Water Pressure Switch contacts to close. Insufficient water pressure will allow these contacts to open, and turn the heat pump off. The display will read “PS” if the water pressure is not sufficient.

Time Delay

All models use a 5-minute time delay. Any interruptions, outside of power loss, will result in a 5-minute time delay.

Low Ambient Temperature

If the air outside the heat pump is too cold, the heat pump will not operate. The actual point at which the unit will cease operating due to low temperature varies. Current weather conditions, the amount of sunlight reaching the heat pump, and the installation quality are primary contributors to this event. The shutdown will occur near 50°F (10°C). This is not a “fixed” range. Low outside air temperatures will activate the systems defrost function by lowering the evaporator’s outlet temperature. The fan motor will operate independently for 15 minutes in attempts to raise the evaporator coil temperature, at which time the heat pump’s control system will check the temperature to see if the coil has warmed up sufficiently to return to normal operation. The control system will run through three 15 minute cycles checking the coil temperature. In the event that the coil does not return to normal operating temperature following the three 15 minute cycles, the heat pump’s control system will shut the unit down completely for 2 hours (display will show “dEF”). After the 2-hour period, the unit will restart to check the evaporator temperature and try to resume normal operation. The heat pump control will continue this cycle until the evaporator temperature returns to normal.
Clearance

A minimum of 2 feet (.6 m) of clearance from walls, shrubbery, equipment, etc. is required around the entire heat pump. This allows for ample air intake. A minimum of 6 feet (2 m) of clearance above the heat pump is required to prevent re-circulation of air. The unit should not be placed underneath eaves, decks, or porches, as this causes re-circulation of air.

RE-CIRCULATION OF AIR BACK INTO THE PUMP WILL GREATLY REDUCE ITS EFFICIENCY

Roof Run-Off

NOTICE - Make sure the heat pump is not located where water may run-off from the roof into the unit. Sharp sloping roofs without gutters will allow large amounts of rainwater, mixed with debris from the roof to be forced through the unit. This will clog, damage, and corrode the unit.

NOTE: A gutter or down spout may need to be installed to protect the heat pump.

Drainage and Condensation

THE HEAT PUMP GENERATES WATER CONDENSATION DURING NORMAL OPERATION. THIS SHOULD NOT BE MISSED FOR A LEAK IN THE UNIT.

A drain hole is provided in the in base pan for adequate removal of condensation and rainwater. Condensation will be produced by the evaporator coil while the unit is running and drain at a steady rate, usually 3 to 5 gallons per hour, depending upon ambient air temperature and humidity. The more humid the ambient air, the more condensation will be produced. If drainage is above this range during operation or if water continues to drain from the base when the heat pump is not in operation for more than an hour, a leak in the internal plumbing may have occurred. The troubleshooting section provides recommendations if leaks are suspected.

NOTICE: Keep the drain hole clear of debris and clean it regularly to remove any obstruction.
NOTICE

Make sure there are no sprinkler heads near the heat pump that will spray on or into the unit. **Sprinkler damage is not covered under the warranty agreement.**

Make sure that sprinklers are placed at a sufficient distance away, so that normal wind will not carry the mist to the heat pump.

The heat pump is designed to handle the wettest weather conditions that are typical of rain and high humidity. Sprinkler heads force high-pressure water into the unit from the side at odd angles. Many sprinkler systems are connected to a ground well system, whose water is high in minerals, sulphur, and other aggressive contaminates that will leave a build up on the evaporator coils causing corrosion and hampering efficiency. If the installed location is within 15 miles of the coast, salt may also be in the well water. Salt contaminated ground well water increases the rate of corrosion and greater care needs to be taken to direct sprinkler water away from the heat pump.

**NOTICE** - If in an oceanfront area, the heat pump should be placed out of direct spray of sand and salt. This will clog, damage, and corrode the unit, which will void the warranty. You may also consider protecting the unit by planting shrubbery or installing a privacy fence between the unit and the prevailing beachfront wind.

**NOTICE** – Damage caused by sand or salt spray will void the warranty.

**POOL COVERS ARE STRONGLY RECOMMENDED**

Using a Pool Cover

A pool loses heat in several ways and testing shows that evaporative cooling (the cooling effect created by water evaporating from the surface of the pool) accounts for approximately 75% of a pool’s heat loss. However, if a pool is covered when not in use, most evaporative cooling can be prevented. If the pool temperature is to be maintained, the pool heating system must replace the heat lost; therefore the use of a pool cover can offer dramatic savings in energy consumption.

A pool cover that reduces evaporative cooling can reduce the heat lost from a pool by approximately 50% (which also reduces your power consumption by 50%).
Operating the HeatPro Heat Pump

NOTICE- Do not use this heat pump if any part has been flooded or submerged in water. Immediately call a qualified technician to inspect and replace any damaged part of the heat pump. Control System components must be replaced if submerged in water. Failure to do so will cause property damage.

Before proceeding, MAKE CERTAIN there are no air or water leaks in any plumbing connections or piping and water is flowing through the unit as setup by the installer.

NOTE: Damage caused by flow rates outside this range will void the warranty.

⚠️ CAUTION - Keep all objects off the top of the heat pump. Blocking airflow could damage the unit and will void the warranty.

Start-Up Procedures

1. Apply power to the pool heater by plugging in the non-fused disconnect block or moving the circuit breaker to the “ON” position.

2. Place the pool heater thermostat in the “Standby” mode by ensuring the light above the “POOL” button (and “SPA” button for dual thermostat application) is not illuminated. If the light(s) are lit, depress the “POOL” button (and “SPA” button for dual thermostat application) to put the unit in “STANDBY” mode.

3. With the pool filter pump operating properly.

4. Push the “POOL” button to activate the unit and then set the pool Heat Pump thermostat to a temperature higher than the current pool water temperature.

5. Allow 5 Minutes for the Heat Pump to start.

6. When the unit starts, confirm that air is being discharged upward from the unit and the air is cooler than the ambient air.

7. Allow the Heat Pump to operate for 10-15 minutes in order for system pressure to stabilize.

8. If Heat Pump fails to start:
   
   a) Check water flow
   b) Ensure that power is On
   c) Refer to Performance Monitoring Section of this Manual
Becoming Familiar with HeatPro Heat Pump Controls

**Display Window** (All Models)
When power is supplied to the unit, the display will either show temperature (in degrees F or C), diagnostic code (such as “rhd”), or scrolling dots.

**Up Arrow Button** (All Models)
 Raises the heat pump temperature set point.

**Down Arrow Button** (All Models)
Lowers the heat pump temperature set point.

**Pool Button** (All Models)
Activates the pool function of the controller.

**Spa Button** (All Models)
Activates the spa function of the controller.

**Run Light** (All Models)
Indicates the unit is operating normally and the thermostat is making a demand for heat.
Control Operation

Dual Thermostat (Models HP20654T, HP20654BT, HP20854T, HP20854BT & HP21104T)

On/Off: This control does not have a true on/off feature. The unit uses standby mode instead. Scrolling dots in the display indicate standby. Standby mode serves two functions. (1) It serves as an “off” mode, which keeps the heat pump from transferring heat into your pool water. (2) Standby allows a pool owner with remote controlling systems, such as Goldline, to maintain pool and spa temperatures via the remote.

To enter Standby mode: If pool mode is active (indicated by the green led over the pool button), press the pool button once. Rolling dots should appear on the display. If spa mode is active (indicated by the green led over the spa button), press the spa button once. Rolling dots should appear on the display.

To exit Standby mode: Press either the pool or spa mode button.

Mode Selection: Select the desired mode of operation (spa or pool) by using the POOL / SPA buttons. A green LED above the buttons designates the active mode. When the pool mode is active, any displays or adjustments apply only to the pool mode. Adjustments for spa mode must be made while the spa button is activated. A user can switch between modes without turning the control to standby first.

Run Indicator Light: Shows the unit is operating normally and the thermostat is making a demand for heat.

Temperature Set point: Pool and spa mode range is 50-104°F (21-40°C).

Adjust the set point: Continuing to hold the up or down arrow button will adjust the set point value until the desired set point is reached. When the desired value has been reached, release the button. The new set point will flash to indicate a new value has been recognized and the display will revert back to water temperature as indicated by a steady display.

To display the set point: Press and release the up or down arrow button once to display the current set point for 3 seconds. For help with this type of control, refer to Troubleshooting Guide with Digital Control.
Changing Temperature Display (All Models):

The control will display temperatures in either degrees Fahrenheit or Celsius. To change the temperature display, place the heat pump in “Stand-By” mode so that the scrolling dots appear on the screen. Press and hold both the pool button and the down arrow button for two seconds and release. Place the heat pump back in pool or spa mode and the temperature change will be displayed. When viewing the temperature in degrees Fahrenheit only the numeric temperature is displayed, but when viewing degrees Celsius the control will display the numeric temperature followed by a lower case “c”.

Lock Out Feature (All Models):

A lock out function is provided to keep the temperature set point from being changed. To engage this function in the pool or spa mode press the up arrow button, down arrow button and pool button at the same time and hold for 2 seconds. The control display will read “LOC” while the lock out function is engaged. To exit the lock out function in pool or spa mode press the up arrow button, down arrow button and pool button at the same time.

Defrost Function (All Models):

The Defrost function is provided to prevent the evaporator coil from freezing when the outside air temperature is near 50°F (10°C). There is no exact temperature at which this function will operate, as each unit will vary depending upon conditions surrounding the heat pump, clearance around the heat pump and heat pump maintenance. This time period will vary from 15 minutes to several hours.

Maintenance

Water Chemistry

Proper chemical balances are necessary for sanitary swimming conditions as well as ensuring your heat pump’s long term reliability.

Sanitizing Equipment

Sanitizers, if used, MUST be installed downstream of the heat pump (in the return line to the pool) and a check valve installed in a manner that will not allow the raw chlorine to drain back to the heat pump when the water filter pump is off. This will prolong the overall life of the heat pump. DO NOT POUR CHEMICALS DIRECTLY INTO THE SKIMMER.

Inspection and Service

Hayward HeatPro heat pumps are designed and constructed to provide long performance life when installed and operated properly under normal conditions. Periodic inspections are important to keep your heat pump running safely and efficiently through the years.

Keep all objects off the top of the heat pump. Blocking airflow could damage the unit and void the warranty.
Owner Inspection

Hayward recommends that you inspect your heat pump on a seasonal basis and especially after significant weather events. Refer to the sections of this Manual: “Clearance”, “Roof Run-Off”, “Drainage and Condensation” for proper inspection.

Professional Inspection

⚠️ WARNING - RISK OF ELECTRIC SHOCK OR ELECTROCUTION. Before servicing heat pump or motor, disconnect ALL electrical power. An EPA Certified service technician MUST perform inspection.

Note: Hayward recommends annual equipment inspections.

Note: Never use high-pressure water to clean evaporator coil fins, as this will cause damage to the coil.

Summertime Shutdown

For certain areas during the summer months, when the heat pump is not needed, you can place the heat pump in standby mode.

End of Season (Winterizing)

Failure to properly winterize heat pump may result in serious equipment damage. **Freeze damage is NOT covered under the heat pump warranty.**

Many pool service companies offer “Winterizing” assistance. Hayward recommends using a professional service technician for these procedures.

- All cleaning of the heat pump. Incorrect cleaning of the unit can cause damage to the heat pump and diminish the operating life.
- Disconnect the power supply (usually at the circuit breaker in your house) prior to winterizing your heat pump.

Cover the heat pump to protect it from snow and water, which may freeze and damage the unit. **BE ABSOLUTELY CERTAIN TO DISCONNECT THE HEAT PUMP FROM THE UNIONS AND DRAIN ALL WATER LINES.**
Some heat pump owners desire their pool to be heated during the winter months. This is possible when daytime temperatures are above 50°F [10°C] for most of Hayward’s heat pumps. If temperatures fall below freezing, be certain to keep the pool filter pump operating continuously to prevent freeze damage.

⚠️ WARNING - While the plumbing connections are in the winterized condition (disconnected from heat pump), it is imperative that the pool / spa water is NOT circulated through the heat pump. Loss of water through loose plumbing connections may result in damage to circulating pump, pool / spa structure and / or other equipment.

Performance Maintenance and Troubleshooting

**Service Procedures**

**Before Calling For Service**

If there appears to be a problem, refer to the troubleshooting section on the following pages.

1. Ensure the swimming pool filtration system is turned on.

2. Ensure the main power circuit on.

3. Verify that the heat pump is not in stand-by mode (pool or spa indicator light is illuminated).

4. Ensure that the heat pump thermostat is set at a temperature above that of the pool or spa temperature.

5. Ensure the outside temperature is high enough to allow the unit to operate. Hayward heat pumps will not turn on when the outside air temperatures near 50°F (10°C).
6. Ensure that the pump and skimmer baskets are clean; also ensure that the pool filter is clean and supplying proper water flow to the heat pump.

7. If the heat pump is not able to maintain the desired temperature, depending on the time of the year, it may be necessary to adjust your pool filtration systems hours of operation (increase run time).

8. If the heat pump does not appear to be heating, check the air temperature being blown out of the top. If the air coming out is cooler than the ambient air, the unit is functioning. If the two temperatures are the same, there may be a problem.

Note: Use a solar blanket / cover on the surface of the pool in order to minimize heat loss.
**Troubleshooting**

**Circuit Breakers:** If it is suspected that a circuit breaker is tripped, turn the breaker to the “Off” position and then back to the “On” position.

**NOTICE:** Service to be conducted ONLY by an EPA Certified Service Technician.

### General Troubleshooting Guide for Hayward HeatPro Heat Pump

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Possible Solution(s)</th>
</tr>

**USE ONLY HAYWARD GENUINE REPLACEMENT PARTS**
HAYWARD® HEAT PUMP POOL HEATER LIMITED WARRANTY

The HAYWARD heat pump pool heater is warranted to be free of defects in materials and workmanship for a period of two (2) years for parts and (1) one year for labor. In the state of Florida, warranty labor is covered for (2) years. This warranty is applicable to the original location and owner only and is not transferable. The compressor component has a five (5) year limited warranty with parts and labor warranted the first two (2) years and parts only warranted in years three (3), four (4) and five (5). The titanium tube component of the heat exchanger has a ten (10) year warranty. HAYWARD will not void this warranty due to improper pool chemistry. This warranty is valid only if the product is installed according to the HAYWARD specifications.

This warranty does not include refrigerant or other expendable materials, or services such as inspection, maintenance, or unnecessary service calls due to erroneous operational reports, external valve position, or electrical service. It also does not include the repair of damage due to negligence, accident, freezing, installation in corrosive environments or atmospheres, conditions beyond the normal intended use of the unit, or acts of God. This warranty is void if the product is repaired or altered in any way by any persons or agencies other than those authorized by HAYWARD, and is in lieu of all other warranties, expressed or implied, written or oral. There are no implied warranties of merchantability or fitness for a particular purpose that apply to this product. This warranty applies to the continental USA, Hawaii, Alaska and Canada. For warranty outside these locations please visit www.haywardnet.com.

At its option, HAYWARD will replace or repair any HAYWARD part that proves defective if such parts are returned to our factory, freight collect, within the warranty period. It is agreed that such replacement or repair is the exclusive remedy available from HAYWARD. Unless authorized by HAYWARD and performed by a factory authorized service center, HAYWARD is not liable for any labor involved in the removal of defective parts or the installation of replacement parts. HAYWARD is not liable for damages of any sort whatsoever, including incidental and consequential damages. Parts returned and services performed under terms of this warranty must be approved by HAYWARD. All parts returned under terms of this warranty will be repaired or replaced and returned transportation charges prepaid, by best and most economical means.

INTERNATIONAL WARRANTY

The HAYWARD heat pump pool heater is warranted to be free of defects in materials and workmanship for a period of one (1) year. The compressor is warranted for two (2) years, and the titanium tube component of the heat exchanger has a ten (10) year warranty.

The above coverage begins from the date of purchase, or sixty days after product manufacture date and applies only if the product is installed according to the HAYWARD specifications. This warranty does not include the repair of damage due to negligence, accident, freezing, installation in corrosive environments or atmospheres, conditions beyond the normal intended use of the unit, or acts of God. There are no implied warranties of merchantability or fitness for a particular purpose that apply to this product.

These warranties apply to units shipped after October 1, 2008

Hayward Pool Products, Inc.
620 Division Street
Elizabeth, NJ 07207
