FOR YOUR SAFETY: Do not store or use gasoline or other flammable vapors and liquids or other combustible materials in the vicinity of this or any other appliance. To do so may result in an explosion or fire.

NOTE: The instructions in this manual are for the use of qualified individuals specially trained and experienced in the installation and maintenance of this type of equipment and related system components. Installation and service personnel are required by some states to be licensed. Persons not qualified shall not attempt to install, service, or maintain this equipment.

This manual should be maintained in legible condition and kept adjacent to the heat pump pool heater or in a safe place for future use.
Rev. 3 reflects the following:

Additions: 3-phase wiring diagrams on pages 23 & 24, phone number on page 15

Changes to: Fig. 1 on page 7, Tables A & B on page 9, phone number on page 12, Fig. 6 on page 17, Fig. 7 on page 18
**Water Chemistry**  
(Corrosive water voids all warranties)

For your health and the protection of your pool equipment, it is essential that your water be chemically balanced. The following levels must be used as a guide for balanced water.

<table>
<thead>
<tr>
<th>Recommended Level(s)</th>
<th>Fiberglass Pools</th>
<th>Fiberglass Spas</th>
<th>Other Pool &amp; Spa Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water Temp. (Deg. F)</td>
<td>68 to 88</td>
<td>89 to 104</td>
<td>68 to 104</td>
</tr>
<tr>
<td>pH</td>
<td>7.3 to 7.4</td>
<td>7.3 to 7.4</td>
<td>7.6 to 7.8</td>
</tr>
<tr>
<td>Total Alkalinity (PPM)</td>
<td>120 to 150</td>
<td>120 to 150</td>
<td>80 to 120</td>
</tr>
<tr>
<td>Calcium Hardness (PPM)</td>
<td>200 to 300</td>
<td>150 to 200</td>
<td>200 to 400</td>
</tr>
<tr>
<td>Salt (PPM)</td>
<td><strong>6000 MAXIMUM</strong></td>
<td><strong>6000 MAXIMUM</strong></td>
<td><strong>6000 MAXIMUM</strong></td>
</tr>
<tr>
<td>Free Chlorine (PPM)*</td>
<td>2 to 3</td>

<td>2 to 3</td>
</tr>
<tr>
<td>Total Dissolved Solids (PPM)</td>
<td><strong>3000 MAXIMUM</strong></td>
<td><strong>3000 MAXIMUM</strong></td>
<td><strong>3000 MAXIMUM</strong></td>
</tr>
</tbody>
</table>

*Free Chlorine MUST NOT EXCEED 5 PPM!*

- Occasional chemical shock dosing of the pool or spa water should not damage the heater providing the water is balanced.
- Automatic chemical dosing devices and salt chlorinators are usually more efficient in heated water. Unless controlled, they can lead to excessive chlorine level which can damage your heater.
- Further advice should be obtained from your pool or spa builder, accredited pool shop, or chemical supplier for the correct levels for your water.

CAUTION: Elevated water temperature can be hazardous. The U.S. Consumer Product Safety Commission has these guidelines:

1. Spa water temperatures should never exceed 104°F (40°C). A temperature of 100°F (38°C) is considered safe for a healthy adult. Special caution is suggested for young children.

2. Drinking of alcoholic beverages before or during spa or hot tub use can cause drowsiness which could lead to unconsciousness and subsequently result in drowning.

3. *Pregnant Women Beware!* Soaking in water over 102°F (39°C) can cause fetal damage during the first three months of pregnancy resulting in the birth of a brain-damaged or deformed child. Pregnant women should stick to the 100°F (38°C) maximum rule.

4. Before entering the spa or hot tub, users should check the water temperature with an accurate thermometer; spa or hot tub thermostats may err in regulating water temperatures by as much as 4°F (2.2°C).

5. Persons with a medical history of heart disease, circulatory problems, diabetes, or blood pressure problems should obtain a physician's advice before using pools or hot tubs.

6. Persons taking medications which induce drowsiness, such as tranquilizers, antihistamines, or anticoagulants, should not use spas or hot tubs.
Introduction

**WARNING:** This pool/spa heat pump pool heater is an electromechanical machine that incorporates a pressurized refrigerant gas in a sealed system. ONLY trained and qualified service personnel are authorized to install or service this equipment. Without proper training and knowledge of such equipment, any attempt to install or service the unit could result in serious injury or even death.

This manual contains important information on the use, maintenance and troubleshooting of your new heat pump pool heater. This unit must be properly installed, maintained and operated for optimal performance.

This heat pump pool heater is an extremely efficient, economical machine designed specifically for swimming pool heating. It is similar in design and operation to a typical residential air conditioning system. The unit employs a hermetic motor/compressor operating in a refrigeration cycle to extract heat from ambient air and deliver it to the circulating pool water.

As with all heat pump pool heaters, compared to other types of heaters such as gas or oil-fired, this heat pump pool heater has lower heating capacity on a BTUH/hr basis. As a result, it will be required to operate longer to accomplish the desired results. It may, at certain times, operate as much as 24 hours per day. However, this should not be of concern to the owner, because the unit is designed to operate continuously. Even though it may operate continuously for many hours, it will still heat the pool with greater economy than other types of fossil fuel heaters.

Place a cover or blanket over the pool at night and other non-use periods. This will keep evaporation, the cause of main heat loss, to a minimum, and will greatly reduce pool heating costs. During warmer weather, the cover may be required only at night.

Installation Considerations

**WARNING:** Do not install the unit within 3 ft of fossil fuel burning heaters. Air intake along the sides of this heat pump pool heater could disturb the combustion process of the unit, and could cause damage or personal injury.

- Mount the unit on a level, sturdy base, preferably a concrete slab or blocks. The size of the base should be at least 3 ft by 3 ft.
- You must install the 4 black rubber sound isolation pads (each 2 inches square) that ship with the unit. The pads are shipped in a bag with the unions, gaskets and the I&O manual. Install pads under the 4 corners of the unit to reduce vibration and sound transmission to the base.

**WARNING:** Do not install the unit under a porch or deck. Refer to Fig. 1.

**WARNING:** This unit is designed for outdoor installation; DO NOT install it in an enclosed area such as a shed or garage.

- Recirculation of cold discharge air back into the evaporator coil will greatly reduce the unit’s heating capacity and efficiency.
- This unit features an ‘up-flow’ discharge for quiet operation. Air is pulled up through the evaporator coil and discharged through the top grill. Allow at least 5 ft (1.5 m) clearance above the unit for unrestricted air discharge. DO NOT install the unit under a porch or deck. Refer to Fig. 1.
- To minimize water piping, locate the unit as close as possible to the existing pool pump and filter.
When installed in areas where freezing temperatures can be encountered, drain the water circuit to prevent possible freeze-up damage. See the Freeze Protection Section.

For high wind installation requirements, refer to the diagram on page 8.

**Electrical Connections**

Refer to the unit rating plate below the control panel for precise power requirements for your unit, and for ampacity and over-current protection requirements.

All wiring must be in accordance with the National Electrical Code, NFPA No. 70, latest edition, and all applicable state and local codes. Wiring diagrams are located on pages 21 through 25.

**NOTE:** Refer to the National Electrical Code, Article 680, for general requirements for swimming pools and equipment, and to Article 440 for special considerations necessary for circuits supplying hermetic refrigeration motor/compressors.

- Locate the equipment disconnect means within 3 feet of the heater's electrical enclosure, or as close to the heater as possible. Always satisfy applicable codes and standards.
- In sizing power wiring, be especially aware of upsizing requirements necessary due to wiring distances. Always satisfy applicable codes and standards.
- Electrical installation should be done by a licensed electrician only.

This unit is pre-wired to work with external control systems, heat-on-demand options and other external time clock overrides. Refer to the external control system’s instructions, and page 26 of this manual, for installation information.

**Water Connections**

**CAUTION:** The heat pump pool heater inlet and outlet connections are **NOT** interchangeable. They must be connected as instructed below.

1. Connect the heat pump pool heater in the return water line between the filter and the pool/spa. See the **Plumbing Diagrams** beginning on page 16.

2. Connect the filter outlet to the fitting marked **WATER IN** at the bottom front of the unit.

3. Connect the fitting marked **WATER OUT** to the return piping to the pool/spa. Unit inlet/outlet connection fittings are 2-inch PVC unions.

Water connections from the unit to the main return line can be PVC pipe or flexible pipe approved for the purpose and, in either case, should be at least equal in size to the main pool/spa circulation piping.

4. In cold weather (freeze zone) areas, shutoff valves (ball or gate type) must be installed at the unit inlet and outlet to facilitate service and cold weather drain-down.

5. Operate the pump and check the system for leaks.

### Pressure Drop

For system pressure drop information, refer to Table B below.

Note: Multiply the pressure drop in psi by 2.3067 to yield the pressure drop in Ft. H₂O Head (TDH).

**Table B: Pressure Drop Across Heat Pump Pool Heater**
**Controls & Indicator Lamps**

(Analog Models)

Your analog heat pump pool heater incorporates safety controls and indicators to ensure its safe, reliable operation (for models with digital controls, see page 11).

**Water Pressure Switch:** Prevents operation when the pump is OFF. The unit requires 5 psi minimum pressure.

**Water Temperature Control:** Pool/spa water temperature is controlled by the heat pump pool heater thermostat on the unit control panel, which contains a switch and 2 thermostats, one for setting a heat spa temperature and the other for a swimming pool temperature. The switch can operate an optional external control system, or can switch between thermostats for pool or spa.

**Defrost Switch:** Prevents heat pump pool heater operation if ambient air temperature falls below a predetermined safe minimum (approximately 42° F).

**Delay Timer:** Prevents compressor from short cycling, which could damage or destroy the hermetic motor/compressor. Upon water temperature control satisfaction, or other circuit interruptions, this solid state device will prevent compressor restart for approximately 5 minutes.

**Refrigerant Low Pressure Control:** Stops the compressor if refrigerant suction (low side) pressure falls too low as a result of a malfunction, loss of charge or extreme cold conditions.

**Indicator Lamps:** There are 6 indicator lamps located on the unit control panel (see Fig. 3 below):

- **Power (amber lamp):** When lit, indicates power is applied to the unit.

**NOTE:** The heat pump pool heater will not run when the **Remote** position is selected on the Pool/Spa selector switch and there is no remote control system attached.

- **Water Flow (green lamp):** When lit, indicates normal water flow.

- **Heat Demand (green lamp):** When lit, indicates the actual water temperature is below the target water temperature.

**WARNING:** Install a check valve and/or a Hartford loop AFTER the heat pump pool heater and BEFORE any chlorinating devices. Install any automatic chemical feeders AFTER the heat pump pool heater. Improper installation of any type of automatic chemical feeders can result in serious damage to, or premature failure of, the heat pump pool heater and will void the heat pump pool heater warranty.

---

**NOTE:** The heat pump pool heater will not run when the **Remote** position is selected on the Pool/Spa selector switch and there is no remote control system attached.
• **Compressor Delay Active (amber lamp):** Under normal operation, when lit, indicates compressor anti-short cycle timer is active. The fan will run but the compressor will be OFF for 6 to 8 minutes.

• **Defrost Active (red lamp):** When lit, indicates unit is in defrost mode. Defrost mode occurs when ice starts to form on the outside coil. The fan will continue to run but the compressor will stay OFF (not heating) until weather conditions improve.

• **Low Pressure (red lamp):** When lit, indicates failure in the refrigeration circuit. When this lamp is ON, service is required. Call for service assistance.

**System Start-Up**

1. Verify that the **Power** lamp is ON and that the pool/spa pump is running and circulating properly.

2. Verify that the control panel **Spa-Remote-Pool** switch is in the **Remote (OFF)** position; see Fig. 4 below.

3. Turn the control switch to either **Pool** or **Spa** to turn the system ON and raise the thermostat setting above the current water temperature. At this time the 2 green lamps should illuminate. The fan and compressor should start up and run simultaneously.

4. Allow the heat pump pool heater to operate for a few minutes to stabilize operating pressures and to allow various component temperatures to normalize.

5. Verify that the discharge air temperature is approximately 8°–10° cooler than the air entering the unit. If not, see the Troubleshooting Section.

**Controls (Digital Models)**

Your heat pump pool heater incorporates digital safety controls and indicators to ensure its safe, reliable operation (for models with analog controls, see page 10).

**Water Pressure Switch:** Prevents operation when the pump is OFF. The unit requires 5 psi minimum pressure.

**Digital Water Temperature Control:** The pool water temperature is controlled by the heat pump pool heater’s digital control system, which gives you the option of two settings: one for the desired spa temperature and the other for the desired pool temperature. Additionally, as mentioned earlier, the unit is compatible with most ‘2-wire’ and ‘3-wire’ control/automation systems.

**Defrost Sensor:** Prevents unit operation if ambient air temperature falls below a predetermined safe minimum (approximately 42°–48°F, based on humidity). The compressor will shut OFF but the fan will continue to run.

**Delay Timer:** Prevents compressor from short cycling, which could damage or destroy the hermetic motor/compressor. Upon water temperature control satisfaction, or other circuit interruptions, this solid state device will prevent compressor restart for approximately 5 minutes.

---

**NOTE:** The heat pump pool heater will not run when the **Remote** position is selected on the Pool/Spa selector switch and there is no remote control system attached.
Digital Controls Operating Instructions

The electronic board has the capability of memorizing two different programmed temperature settings as follows (refer to Fig. 5):

- For a pool, maximum 95°F (35°C)
- For a spa, maximum 104°F (40°C)

To Select Pool or Spa Mode

To have access to either one of these programs, press the SET key until you see \textbf{P}_S and by pressing the UP or DOWN key you can switch to POL or SPA.

To Increase the Desired Water Temperature (Pool or Spa Mode)

Push the SET key until you see POL or SPA. The programmed temperature will be displayed. Press the UP arrow to increase the temperature setting one degree at a time.

To Lower the Desired Water Temperature (Pool or Spa Mode)

Push the SET key until you see POL or SPA. The programmed temperature will be displayed. Press the DOWN arrow to decrease the temperature setting one degree at a time.

Once the control has been programmed to the desired pool water temperature, the programmed temperature will be displayed for approximately 5 seconds. Then the digital display will display the actual pool water temperature.

To make the Board a Pool ONLY Board, call 800-260-2758 for instructions.

To Select Temperature in °C or °F

Press the SET key until you see \textbf{F}_C. By pressing the UP or DOWN key you can switch to °F or °C. Once the temperature display mode has been programmed it will be displayed for approximately 5 seconds, then the digital display will return to the actual pool water temperature in the mode that you have chosen.

Heat/Cool Operation (Model 6350HC Only)

The heat/cool model is designed to both heat and cool the pool. To select heat or cool mode, push the SET key until \textbf{H/C} is displayed. Press the DOWN arrow key to select heating (\textbf{hea}), or the UP arrow key to select cooling (\textbf{coi}). Set the desired setpoint temperature as described earlier in this manual.

\textbf{NOTE:} Once the control has been programmed to the desired pool water temperature, the programmed temperature will be displayed for approximately 5 seconds. The digital display will then show the actual pool water temperature.

\textbf{NOTE:} Remove the pool/spa blanket and turn on any fountains, sprays or other water features to speed cooling.

When the unit has been operating in the heating mode for a few minutes, the discharge air temperature should be 8°–10°F cooler than the air entering the unit.

When the unit has been operating in the cooling mode for a few minutes, the discharge air temperature should be 8°–10°F warmer than the air entering the unit.

\textbf{NOTE:} Heating is more efficient during warmer daylight hours and cooling is more efficient during cooler night time hours.
System Start-Up

1. Verify that the Digital Board is displaying a temperature and the pool pump is running and water is circulating properly.

2. Verify that the Board is programmed so that the desired temperature of the Pool and Spa is higher than the displayed current water temperature.

3. Allow the heat pump pool heater to operate for a few minutes to stabilize operating pressures and to allow various component temperatures to normalize.

4. Verify that the discharge air temperature is approximately 8°–10°F cooler than the air entering the unit. If not, see the Troubleshooting Section.

Seasonal Start-Up or Annual Check

NOTE: At the beginning of the heating season, or whenever the pool water temperature is to be raised several degrees, the pool pump and heat pump pool heater may need to operate continuously for several days. During summer months, only a few hours per day may be necessary, or none at all.

1. Remove leaves, pine needles, etc., from the evaporator coil. Clean the coil by gently applying a mild solution of household liquid soap and water.

2. Gently rinse the coil with water; DO NOT use high pressure.

3. Backwash or otherwise clean the pool filter. If necessary, clean the skimmer basket and pump strainer.

NOTE: If the pool pump and heat pump pool heater shut OFF before the water temperature is raised to the desired level, you must lengthen the running time of both. To do this, reset the time clock dial for the longer running time, or manually operate the pump with the timer override switch. Since the heat pump pool heater capacity and efficiency are both greater at higher ambient air temperatures, run time should be set to take advantage of all daylight hours, when the air is generally warmer.

4. Set the valves to ensure proper water flow through the unit.

Summer Shutdown

If you do not plan to use the heat pump pool heater during the summer months, secure and protect it as follows:

1. Turn the unit circuit breaker or disconnect switch to OFF.

2. Leave the valves set the way they are unless additional circulation is required. DO NOT stop all flow through the heat pump pool heater.

3. IMPORTANT: Remember to reset the valves before the next heating season, or the unit will not operate properly.

Freeze Protection

If the unit is installed in a location subject to freezing conditions, it is important to protect the water circuit from freezing, just as should be done for the pump and filter.

System Drain-Down

1. Turn the unit circuit breaker or disconnect switch to OFF.

2. With the pool pump OFF, close the external shut-off valves and loosen the inlet and outlet water unions to allow water to drain. Use a Wet/Dry Vac or air pressure to remove excess water.

3. Loosely re-attach the unions.

4. Cover the unit with a waterproof cover.

Continuous Pump Operation

It is also possible in some areas to prevent unit freeze damage by operating the pump continuously during freezing weather. However, this results in significantly higher pump operating costs. Further, if a sustained power failure occurs, the unit MUST be drained anyway, or freeze damage could result.
**Troubleshooting**

If your unit does not operate, or simply does not heat your pool water, Fault Codes (digital models), or the indicator lamps (analog models) on the front control panel, can provide valuable clues as to what is wrong, and may even indicate precisely what the problem is. Always observe these codes (or lamps) before calling a service representative. By reporting on the telephone the Fault Codes (or which lamps are ON or OFF) that are showing, the service rep may be able to solve the problem without the expense of a service call.

**A. UNIT IS RUNNING, BUT NOT HEATING**

- Is water flow through the unit adequate? Check the unit for obstructions, such as a clogged filter pump strainer, a dirty filter, or valves not positioned correctly.

- Is the ejected air from the unit 8°–10°F cooler than incoming air? If so, the unit is extracting heat from the air and transferring it to the pool.

- Is water condensing on the evaporator and internal copper pipes? This is also evidence of heat removal from the air. When the air is cool with low humidity, condensation may not be evident.

- How long has the unit been operating? During initial pool heating in cold weather, it may require a week to elevate the water temperature to a comfortable level. Normally, it takes about 4 days.

  How many hours per day is the unit operating? Remember that the heat pump pool heater only operates while the pool pump is running. Set the time clock to permit 24 hour per day operation. After the desired temperature is reached, return the unit to normal operation of 8–10 hours per day.

**NOTE:** If the pool pump and heat pump pool heater shut OFF before the water temperature is raised to the desired level, you must lengthen the running time of both. To do this, reset the time clock dial for the longer running time, or manually operate the pump with the timer override switch. Since the unit capacity and efficiency are both greater at higher ambient air temperatures, run time should be set to take advantage of all daylight hours, when the air is generally warmer.

- Is airflow through the unit being obstructed? Restrictions such as shrubbery, tall grass, dirty

---

**Maintenance**

**NOTE:** The heat pump pool heater MANUFACTURER IS NOT RESPONSIBLE for maintenance adjustments.

The following maintenance procedures are designed to keep your unit operating at a high level of reliability. **Maintenance must be performed on a periodic basis to maintain warranty coverage** and prevent system failures and performance degradation.

### Air Coil Cleaning

Efficient operation depends on free circulation of air through the thin and tightly-spaced fins of the evaporator coil(s). The evaporator **must** be cleaned whenever it has a buildup of dirt or debris.

**CAUTION:** To clean the fins, spray gently with a garden hose. **DO NOT pressure wash.** Doing so will bend the fins and can void the warranty.

### Cabinet Care (optional)

The cabinet is designed for outdoor use and requires little care. However, you can clean it if you wish.

**WARNING:** Shut OFF electricity to the unit before cleaning.

Wash the cabinet with soap and water.

### Unplug Condensation Drain Holes

The unit extracts humidity from the air as it passes through the coil, similar to the way a cold drink outside “sweats” on a hot day. This condensation drains from the bottom of the unit.

1. Routinely check to be sure the condensation drain holes in the base of the unit are not plugged with dirt or debris.

2. If condensation becomes a problem, optional drain pans are available from your heat pump pool heater distributor or pool dealer.
coils, or any other obstruction to airflow will reduce performance.

- Is the pool blanket/cover being used? Unblanketed pools can lose up to 10 degrees per night compared to 4 degrees or fewer when a blanket is used. Without a blanket, the total heat gained during the day can be lost overnight.

- Are rapid heat losses occurring in some other way, such as high wind, spillage, rainfall, flow through solar panels at night, or a high water table?

B. UNIT IS NOT RUNNING

- Is the temperature display or control panel Power lamp ON? If not, the circuit breaker may be shut OFF or tripped. Reset the breaker by switching it OFF, and then back ON. Verify that the breaker is set and operating properly before calling for service.

- Is the thermostat setting and the Pool/Spa setting correct? Verify that the temperature has been properly set on the thermostat, and that it is higher than the current water temperature. On analog units, all 3 lamps should be illuminated and the fan should begin to run.

- Have you waited approximately 5 minutes for the time delay? After the unit has been running and then shut OFF for any reason, there is a delay before operation can begin again.

- Is the Heat Light or Heat Demand lamp ON? If not, then the thermostat setting is not higher than the temperature of the water. Raise the thermostat setting.

NOTE: The heat pump pool heater will not run when the Remote position is selected on the Pool/Spa selector switch and there is no remote control system attached.

C. CONDENSATION SEEMS EXCESSIVE

Heat pump pool heaters can produce a large amount of condensation (water) during operation. If you suspect that the unit is leaking:

a. Use a pool chemistry test kit to confirm there is no chlorine in the condensation. Or,

b. Shut the unit OFF and leave the filter pump running to see if the water stops dripping. If the water stops dripping, the unit is not leaking.

Service Call Verification

NOTE: The Raypak Service number is 800-260-2758.

Before you make a service call, first determine if the problem is:

- Warranty Service
- Unit operation (power supply, water flow, or time clock adjustment)

NOTE: The MANUFACTURER IS NOT RESPONSIBLE for these adjustments.

Power Supply

- Verify that all circuit breakers are reset and working properly.

- If the temperature display or the Power lamp on the control panel still does not light, contact the installing dealer, since it may be a power problem requiring an electrician.

Water Flow

- Verify that the pool filter is clean to provide good flow.

- Verify that valves are properly positioned to allow adequate water flow through the unit.

- If the Water Flow lamp (analog models) on the control panel still does not light, and water is circulating in the pool, verify that all valves are positioned correctly.

Time Clock Adjustment

Verify that the time clock is set to permit the unit to run long enough to heat properly.

Valve 'C' are isolation valves

Main piping
Branch piping
Main and branch piping for future installations

From pool

This piping diagram is Raypak's recommendation and is not intended to replace an engineered piping system designed by a professional engineer.

Minimum pipe sizes

Notations:
1. Plumebowing check valve in gravity-closed position.
2. Minimum pipe size must be equal to the heater inlet/outlet size. See 'Minimum pipe sizes' chart above.

Heat pump shown represents various models. Because individual models will vary in design and piping, see each pump for details.
USE TERMINALS 21 & 22 TO ATTACH 2-WIRE CONTROL SYSTEMS THAT HAVE THEIR OWN SENSORS FOR TEMPERATURE CONTROL.

USE TERMINALS 22, 23 & 24 TO ATTACH 3-WIRE CONTROL SYSTEMS THAT UTILIZE OUR TEMPERATURE SENSOR FOR TEMPERATURE CONTROL.

TO ENGAGE AN EXTERNAL CONTROL SYSTEM, PUT THE POOL-REMOTE-SPA SWITCH IN THE REMOTE POSITION.

Remote Control Field Connections

Wiring Information
- Line Voltage: 208V/230V
- Transformer Standard: Factory Installed
- Low Voltage: Factory Standard

Notes:
- Transformer wired for 240V, black & orange wire for 240V, black & red wire for 208V
- Sensor rated @ 75° F / 5.6k
- 24° F / 5.6k

Use terminals 21 & 22 to attach 2-wire control systems that have their own sensors for temperature control.
Installing a Remote Control Device on Analog Heaters

Wiring

For a 2-wire control, use the TOTAL and COMMON connections on the heat pump pool heater wiring block.

For a 3-wire control, use the COMMON, SPA and POOL connections on the heat pump pool heater wiring block.

Heater Settings

1. To operate the heater using a 2-wire remote control device, simply switch the Spa-Remote-Pool knob to the Remote position and make sure the heater is enabled on the remote control device.

2. To operate the heater using a 3-wire remote control device, simply switch the Spa-Remote-Pool knob to the Remote position and set the temperature for pool and spa.

Installing a Remote Control Device on Digital Heaters

Wiring

For a 2-wire control, use the TOTAL and COMMON connections on the heat pump pool heater wiring block.

For a 3-wire control, use the COMMON, SPA and POOL connections on the heat pump pool heater wiring block.

Heater Settings

1. Make sure the heater is disabled on the remote control device. Then, push the SET key until POL is displayed. Push the DOWN arrow key until OFF is displayed. Wait until a temperature is displayed before beginning the next step.

2. Push the SET key until SPA is displayed, then push the UP arrow to 104°F. Wait until a temperature is displayed before beginning the next step.

3. Push the SET key until P_S is displayed, then push the DOWN arrow until POL is displayed. Wait until a temperature is displayed before beginning the next step.

4. Finally, enable the heater on the remote control device. When there is a call for heat, the heater display will show SPA. When the heater is disabled, the display will show POL.
